

This is an interactive meeting with an interview panel of 2 people – the Hiring Manager and 1 person from the team. We recommend you put together a PowerPoint presentation. You are able to share your screen during the zoom interview to present your deck!

***Key attributes for a successful candidate in this job are a skill for storytelling and courageous curiosity. You should try to display your talent for both in your answers to all three questions.*

1. **Who you are:** who are you? Why do you want to get into the world of analytics? Share anything you want about you! (~5-10 minutes).

2. **Craft Demonstration Exercise:** This is your opportunity to shine! Please share how you'd address this real-life scenario:

Intuit QuickBooks enables Small Businesses to accept payments.

However, there are instances when fraudsters take advantage of the system and commit fraud. Common examples include stealing a real identity, or taking over a real account without the real owner's knowledge. Intuit is liable for the losses due to these fraudulent activities.

In our group we analyze data to identify suspicious merchants that expose us to risk to decline or close those accounts.

Background: For this case, we have data showing recent historical credit card charge volume and the associated disputes (chargebacks) and losses from those disputes.

The historical data extends from Jan 2021 until Dec 2021. You will find the following fields:

channel	how did the account owner originally sign up for payments
account_open_ind	is the account open at the end of the period (yes=1, no=0)
close_reason	why was the account closed
mcc	standard industry classification code
mcc_description	standard industry description
location_state	state the account operates in
account_open_date	day the account was opened
close_date	day the account was closed (null if open)
credit_score_tier	a rating of the credit risk of the account (not fraud risk)
txn_date	date the transaction occurred
cb_date	date the dispute was received (null if no dispute)
outcome	what was the resolution of the dispute (see below)

txn_amount	amount of the transaction in dollars
chargeback_amt	amount of the dispute in dollars
txn_key	primary key
outcomes:	
IntuitLoss	the merchant lost the dispute and Intuit was unable to collect the debt (loss to Intuit)
MerchLoss	the merchant lost the dispute but Intuit collected the debt (no loss to Intuit)
MerchWin	the merchant won the dispute (no loss to merchant or Intuit)
null	no dispute or incomplete resolution process
Reversal	the dispute was canceled before resolution (no loss to merchant or Intuit)
Unknown	unable to determine or incomplete dispute resolution

We want to use the historical data to predict the likely loss amount per month for the next 12 months (Jan 2022- Dec 2022).

Assignment: Please prepare a short PowerPoint presentation designed for Executive Leadership of the cross-functional Payments team to present your work. The presentation should set the context of historical trends, highlight any interesting insights or anomalies, and the likely outlook in future months. The cross-functional Payments executive team includes senior leaders from Product, Risk, Finance, Accounting, and Commercial arms of QuickBooks Payments, as well as peers and other stakeholders, so prepare your content at the appropriate altitude.

The data set provided is a dramatically stripped down version of what would be available to you on the job. Feel free to talk about any additional analyses, metrics, KPIs, or external inputs you might include if you had the extra time and resources.

(Aim to spend ~3 hours on this assignment)

(Feel free to ask us any questions. This test is intended to assess your approach to solving problems with data, not your risk or fraud domain knowledge.)

(~25 minutes craft demo + ~25 minutes Q&A)
